

AuthRequest is a biometric identity check for your communications.

Before acting on an email or request, employees can quickly confirm who they're dealing with through a simple, secure step that attackers can't access.

This adds confidence to everyday communication and reduces the risk of costly mistakes.

The Defense Against Business Email Compromise

Key Features

On-Demand, User-Initiated Verification

Verify requests only when needed, with real-time confirmation that supports employee judgment and organizational policies.

Secure, Separate Communication

Verification happens through an encrypted mobile app, keeping it protected from attackers.

Biometric Identity Verification

Confirm identity using Face ID or fingerprint, providing stronger assurance than passwords or codes without exposing biometric data.

Easy Adoption, No Barriers

Anyone can respond instantly with no setup required, making it easy to verify requests across teams, vendors, and partners.

Auditable and Transparent

Every verification creates a secure, tamper-proof record, providing clear visibility and supporting compliance and investigations.

The Verification Gap

Traditional email security tools aren't designed to stop threats that look legitimate and manipulate human behaviour. Manual verification is often slow, inconsistent, and skipped.

These types of requests can be difficult to recognize:

- Urgent requests that push people to act quickly
- Changes to sensitive information that seem valid
- Messages that appear to come from trusted people
- Requests sent from compromised email accounts
